Gangify WooCommerce Setup Guide

Installation, product connection, and dashboard configuration

This guide walks through the standard WooCommerce setup for Gangify. It assumes that WordPress and WooCommerce are already installed and that you have administrator access.

Gangify training covers the Gangify connection and standard setup. It does not replace general WordPress, WooCommerce, theme, hosting, checkout, or custom-development support.

Before You Begin

- **A working WooCommerce store:** Your website must already be able to create and publish products.
- **Administrator access:** You need access to WordPress settings, plugins, WooCommerce products, and theme customization.
- **Access to the WordPress administrator email:** Gangify uses this email to create and connect the Gangify dashboard account.
- **A credit card:** Gangify requires a card on file. SuperGamut VIP customers should contact their account representative after setup so the correct VIP plan can be applied.
- **A simple WooCommerce product:** Gangify products must be created as Simple products. Do not use a Variable product.

IMPORTANT: Every WooCommerce product connected to Gangify must use the Simple product type. Variable products will not connect and function correctly with the standard Gangify workflow.

Step 1: Verify the WordPress Administrator Email

Before installing the Gangify plugin, confirm the administrator email assigned to the WordPress site. This address will be used to create and associate the Gangify dashboard account.

1. In WordPress, go to Settings.
2. Open the General settings page.
3. Locate Administration Email Address.
4. Confirm that the address is correct and that you can access its inbox.
5. Save the settings if you make a change.

Do not continue until the administrator email is correct. Changing it after the Gangify account is created may require additional account assistance.

Step 2: Download the Gangify WooCommerce Plugin

1. Open Gangify.com.
2. Go to the Integrations section.
3. Locate the WooCommerce integration.
4. Click the plugin download button.
5. Save the downloaded ZIP file to your computer.

Do not unzip the downloaded file. WordPress expects the Gangify plugin to be uploaded as a ZIP file.

Step 3: Install and Activate the Plugin

1. In WordPress, go to Plugins.
2. Click Add Plugin or Add New Plugin.
3. Click Upload Plugin.
4. Choose the Gangify WooCommerce ZIP file you downloaded.
5. Click Install Now.
6. After installation is complete, click Activate Plugin.
7. Return to the Plugins page and confirm that Gangify is active.

Step 4: Review the Gangify Plugin Settings

From the WordPress Plugins page, locate Gangify and open its Settings. The available options may include:

- Gangify builder button text
- Builder button background color
- Builder button text color
- Optional custom CSS

Choose clear button text such as “Build Your Gang Sheet,” “Open Gang Sheet Builder,” or “Design It.” The button should clearly tell the customer that it opens the Gangify builder.

Step 5: Create the Gangify Dashboard Login

1. Check the inbox for the WordPress administrator email.
2. Open the Gangify account-registration or password-setup email.
3. Click the link in the email.
4. Create a secure password.
5. Go to dashboard.gangify.com.
6. Sign in using the WordPress administrator email and the password you created.

Step 6: Add a Card on File

1. Inside the Gangify dashboard, open Payment Settings.
2. Enter the required card information.
3. Save the card.
4. Confirm that a card is listed as the primary payment method.

SuperGamut VIP customers receive Gangify access at no additional software cost, but the platform still requires a card on file. After setup, notify your SuperGamut account representative so your account can be placed on the correct VIP plan.

Step 7: Create a WooCommerce Product

Gangify pulls products from WooCommerce. Create the storefront product in WooCommerce first, then configure its builder behavior in the Gangify dashboard.

1. In WordPress, go to Products.
2. Click Add New Product.
3. Enter a clear product name, such as “DTF Gang Sheet Express,” “Studio Gang Sheet Builder,” or “Full Gang Sheet Upload.”
4. Add the product description, image, category, and other storefront information you want customers to see.
5. In the Product data section, select Simple product.
6. Do not select Variable product.
7. Enter a placeholder or starting price if WooCommerce requires one. Gangify will calculate the actual builder price based on the settings configured in the Gangify dashboard.
8. Disable inventory tracking unless you have a specific reason to use it.
9. Publish or update the product.

REQUIRED: The WooCommerce product must be a Simple product. Gangify does not use WooCommerce variations to control gang sheet sizes or builder options. Those choices are configured in the Gangify dashboard.

Step 8: Confirm the Product Syncs to Gangify

1. Return to dashboard.gangify.com.
2. Open Products.
3. Locate the WooCommerce product you just created.
4. If it does not appear immediately, wait briefly and refresh the page.
5. Confirm that the product title matches the WooCommerce product.

WooCommerce controls the storefront product. Gangify controls the builder type, canvas settings, gang sheet options, and pricing behavior.

Step 9: Select the Correct Gangify Builder Type

In the Gangify Products area, use the Designer Tool or builder drop-down for the synced product. Select one of the following:

Builder	Best Use
Gangify Express	Customers upload artwork, enter size and quantity, and Gangify builds the sheet automatically.
Gangify Studio	Customers can build and arrange their own sheet using preset or dynamic sheet sizing.
Gangify Upload	Advanced customers upload a completed, production-ready gang sheet.

Step 10: Configure the Product in the Gangify Dashboard

Selecting the builder type is not enough. Open the product’s pricing or variant settings and complete the fields required for that builder.

Express Builder

- Select the correct product type, such as Direct to Film or the appropriate expanded-gamut option.
- Enter the usable canvas width for your printer and film.
- Enter the maximum rolling canvas length.
- Enter the base price per linear inch.
- Save the settings.
- Optionally configure tier pricing by maximum sheet length and price per linear inch.

Studio Builder with Preset Sizes

- Create the required gang sheet variants in Gang Sheet Variants.
- Enter the width and length for each preset sheet size.
- Return to Products and open Manage Variant Pricing.
- Select the correct product type.
- Enable the sheet sizes that should be available.
- Enter and save the price for each size.

Studio Builder with Dynamic Sizing

- Select Gangify Studio for the product.
- Open Manage Variant Pricing.
- Select the correct product type.
- Enable Dynamic Size Mode.
- Enter the usable canvas width.
- Enter the maximum rolling canvas length.
- Enter the base price per linear inch.
- Optionally configure tier pricing.
- Save the settings.

Full Gang Sheet Upload

- Select Gangify Upload for the product.
- Select the correct product type.
- Enter the maximum canvas length.
- Enter the price per linear inch.
- Optionally configure tier pricing.
- Save the settings.

All prices shown in training examples are demonstrations only. Set pricing from your own equipment, labor, overhead, turnaround, market, and profit requirements.

Step 11: Test the Storefront Product

1. Open the WooCommerce product on the public storefront.
2. Confirm that the Gangify builder button appears.
3. Click the button and verify that the correct builder opens.
4. Upload test artwork.
5. Confirm the canvas width, size options, maximum length, and pricing behave as expected.
6. Review warning messages, file-type controls, DPI warnings, and add-to-cart confirmations.

7. Complete a test order before promoting the product publicly.

Step 12: Prevent Customers from Bypassing Gangify

Some WooCommerce themes display a standard Add to Cart button on the product page, category page, or both. For a Gangify product, customers should enter through the Gangify builder, so artwork and builder data are captured correctly.

You will need custom CSS to hide the standard WooCommerce Add to Cart button on:

- The individual Gangify product page
- WooCommerce category or product-archive pages

Here is an example customer CSS code that should work for most themes:

```
/* Hide ONLY the WooCommerce single add-to-cart button
(keep other buttons/links) */
.single-product
button.single_add_to_cart_button {
    display: none !important;
}
```

```
/* Optional: if you also want to hide the
quantity selector but keep other custom
buttons */
.single-product form.cart .quantity {
    display: none !important;
}
```

```
/* Hide ONLY WooCommerce add-to-cart
buttons on product grids */
.woocommerce ul.products li.product
a.add_to_cart_button,
.woocommerce ul.products li.product
a.ajax_add_to_cart,
.woocommerce ul.products li.product
a.product_type_simple.add_to_cart_button,
.woocommerce ul.products li.product
a.product_type_variable.add_to_cart_button,
.woocommerce ul.products li.product
a.product_type_grouped.add_to_cart_button,
.woocommerce ul.products li.product
a.product_type_external.add_to_cart_button {
    display: none !important;
}
```

The exact CSS depends on the WordPress theme and other plugins installed on the site. Do not paste unverified generic code into a live store. Have a WooCommerce expert confirm the correct selectors for your theme, or use paid setup assistance.

Final Setup Checklist

- ☐ WordPress administrator email is correct and accessible.
- ☐ Gangify WooCommerce plugin is installed and active.
- ☐ Gangify dashboard password has been created.
- ☐ A card is saved in Payment Settings.
- ☐ The SuperGamut VIP plan has been requested or confirmed.
- ☐ The WooCommerce product is a Simple product.
- ☐ The product appears in the Gangify dashboard.
- ☐ The correct Gangify builder type is selected.
- ☐ Product type, canvas width, maximum length, and pricing are configured.
- ☐ Preset variants or dynamic sizing are configured when applicable.
- ☐ The Gangify builder button appears on the storefront.
- ☐ Standard Add to Cart buttons cannot bypass the Gangify workflow.
- ☐ A complete test order has been submitted and reviewed.

Troubleshooting

The product does not appear in Gangify: Confirm that it is published as a Simple product, refresh the Gangify Products page, and verify that the plugin is active.

The wrong email received the Gangify invitation: Check the WordPress Administration Email Address. Account changes may require assistance.

The builder button is missing: Review the Gangify plugin settings, confirm the plugin is active, and check whether the theme is overriding product-page buttons.

The normal Add to Cart button still appears: The theme likely requires custom CSS or template customization. Contact a WooCommerce expert.

The builder opens but pricing is missing: Open the synced product in Gangify and complete all required canvas, length, variant, and pricing settings.

Support Boundary

This guide covers the standard Gangify connection and product setup. WooCommerce themes, page builders, checkout plugins, caching tools, security settings, hosting configurations, and custom code can change how a store behaves. For platform-specific issues, work with a qualified WordPress or WooCommerce expert. We may be able to provide paid assistance depending on availability and the scope of work.
